Problem Statement & Prototype Concept

Why LifeBridge was designed

PROBLEM STATEMENT

Road accidents often require immediate first-aid, but professional medical help may take time to arrive. People present at the accident site may not know the correct emergency steps, which can lead to delayed or improper assistance. LifeBridge aims to reduce this critical delay by providing AR-based real-time first-aid guidance and VR-based emergency-response training.

PROTOTYPE DESCRIPTION

LifeBridge is an AR/VR-based emergency-response prototype designed to reduce delayed help after accidents. The AR component provides quick, step-by-step first-aid guidance during an emergency, while the VR component provides a simulated environment where users can practice emergency-response actions safely. The goal is to bridge the critical gap between an accident and professional care - not to replace medical professionals.

AR

Real Emergency + Digital Guidance

Shows short first-aid instructions and emergency actions over the real/simulated accident scene - for example checking the victim, calling for help, and guiding immediate response.

VR

Virtual Emergency + Practice

Creates an interactive accident-training scenario where the user can practice scene safety, victim checks, calling for help, and CPR-related emergency steps before a real emergency occurs.

KEY OUTCOME

LifeBridge demonstrates how AR can provide immediate first-aid guidance during a crisis, while VR can prepare users through safe, repeatable emergency-response training. Together, they help connect a crisis to proper care faster.
